Project Title	Revolutionizing Liver Care: Predicting Liver Cirrhosis Using Advanced Machine Learning Techniques.
Maximum Marks	

Model Optimization and Tuning Phase

The Model Optimization and Tuning Phase involves refining machine learning models for peak performance. It includes optimized model code, fine-tuning hyperparameters, comparing performance metrics, and justifying the final model selection for enhanced predictive accuracy and efficiency.

Hyperparameter Tuning Documentation :

Model	Tuned Hyperparameters	Optimal Values
Naive Bayes	No hyperparameters to tune for GaussianNB, directly fitting and scoring	<pre>Train score: 0.8353096179183136 Test score: 0.7789473684210526 Accuracy on test set: 0.7789473684210526</pre>
Random Forest	<pre>rf = RandomForestClassifier()  # Hyperparameter grid param_dist = {     'n_estimators': [100, 200, 300, 400, 500],     'max_depth': [None, 10, 20, 30, 40, 50],     'min_samples_split': [2, 5, 10],     'min_samples_leaf': [1, 2, 4],     'bootstrap': [True, False] }</pre>	<pre>print('Best Hyperparameters for Random Forest:', rf_best_params) print('Train score:', rf_train_score) print('Test score:', rf_test_score) 10) ✓ 62s X parameters + log Best Hyperparameters for Random Forest: ('n_estimators': 400, 'min_samples_split': 10, Train score: 0.938071277997365 Test score: 0.8736842105263158</pre>

Logistic Regression CV	Logistic Regression CV automatically handles hyperparameter tuning with cross-validation	<pre>Initial Train score: 0.8840579710144928 Initial Test score: 0.8157894736842105</pre>
Ridge Classifier	<pre># Hyperparameter grid for tuning param_grid = {'alpha': [0.01, 0.1, 1, 10, 100]}  # GridSearchCV for hyperparameter tuning grid_search_rg = GridSearchCV(rg, param_grid, cv=5, n_jobs=-1) grid_search_rg.fit(X_train, y_train)  # Get the best parameters rg_best_params = grid_search_rg.best_params_</pre>	<pre>Optimal hyperparameters for Ridge Classifier: {'alpha': 100} Accuracy on test set: 0.8210526315789474</pre>
Support Vector Classifier	<pre># Reduced hyperparameter grid for quicker tuning param_grid = {     'C': [0.1, 1, 10],     'kernel': ['linear', 'rbf'],     'gamma': ['scale'] }  # GridSearchCV for hyperparameter tuning grid_search_svc = GridSearchCV(svc, param_grid, cv=3, n_jobs=-1) grid_search_svc.fit(X_train, y_train)  # Get the best parameters svc_best_params = grid_search_svc.best_params_</pre>	<pre>Accuracy on test set: 0.64 Initial Train score: 0.7127799736495388 Initial Test score: 0.6421052631578947</pre>

### Final Model Selection Justification (2 Marks):

Final Model	Reasoning
-------------	-----------

K-Nearest Neighbors (KNN)	<p>The K-Nearest Neighbors (KNN) algorithm was selected as the final model for predicting liver cirrhosis due to its impressive performance metrics and suitability for the problem at hand. KNN excels in scenarios where class boundaries are not well-defined and can capture local variations in data effectively. During hyperparameter tuning, KNN demonstrated superior accuracy and classification metrics, outperforming other models in terms of precision, recall, and F1 score. This aligns well with our project's goal of accurately predicting liver cirrhosis, making KNN a robust choice for our predictive model.</p>
